

Establishment of Remote-Sensing Based Monitoring Program for Performance Limit State Assessment of the Sacramento Delta Levees

CRC 2nd Annual Meeting: February 1-3, 2017

Chapel Hill, NC

Principal Investigator / Institution: Victoria Bennett, Rensselaer Polytechnic Institute

Research Participants/Partners:

Mohammed Gabr, NCSU

Brina Montoya, NCSU;

Tarek Abdoun, RPI

Mourad Zeghal, RPI;

NASA/Jet Propulsion Laboratory, Pasadena, CA;

Joel Dudas, Department of Water Resources, Sacramento, CA;

USACE, Vicksburg, MS;

Amr Helal and Rowshon Jadid, Ph.D. Students, NCSU

Project Overview

Scope: Enhancing Resiliency of the California Delta Levees

- **Validated Remote-Sensing Based Monitoring Program**
 - Sherman Island Monitoring – In Situ and Remote
- **Assessment of Functionality Level Under Severe Storms**
 - Incorporation of Peat Decomposition and Related Effect
 - Characterization of Resilience Response
- **Dissemination**
 - Levee Displacement Dataset
 - Updating of Software - Risk Estimator for Embankment Structures (REES)
 - Development of a User Manual for REES Software

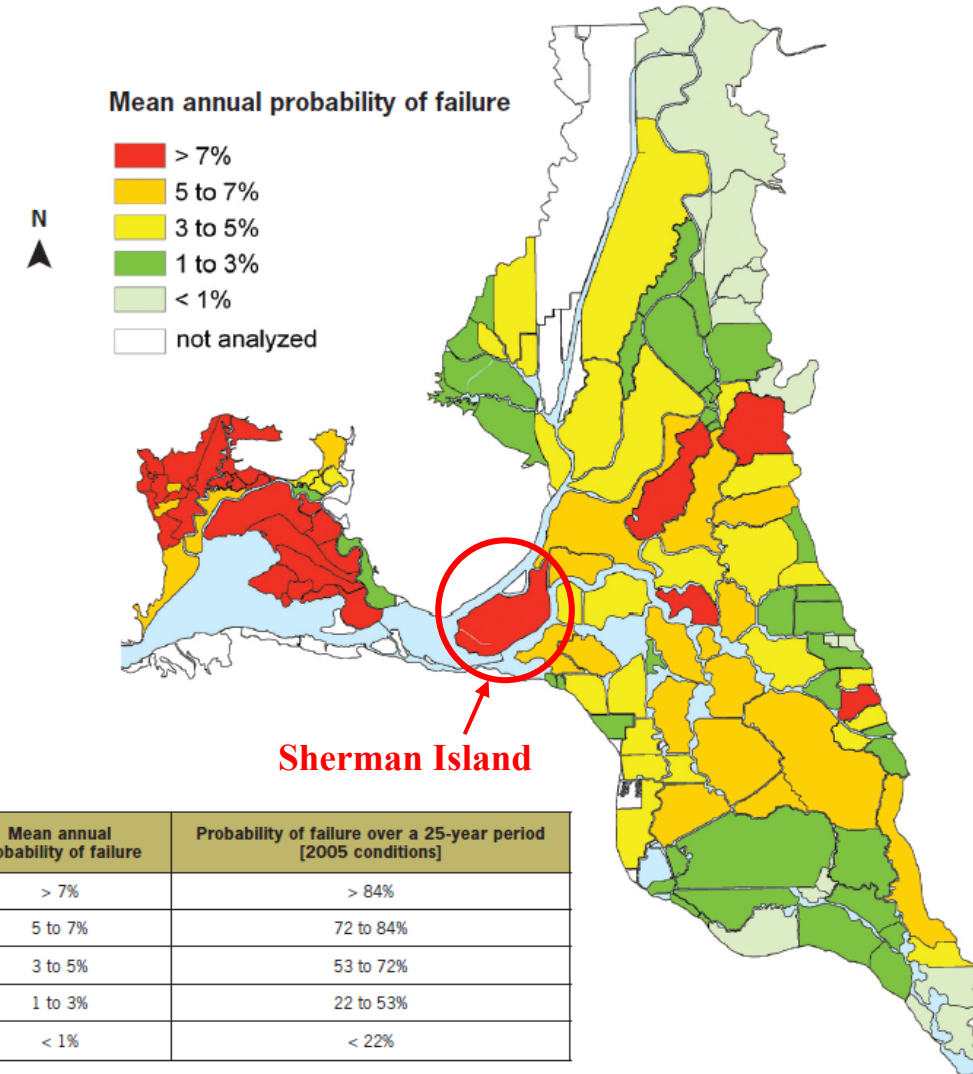

Figure 12 Mean annual probability of levee failure in the Delta Region from the combined risk of earthquakes, high water and dry-weather failures [2005 conditions]

Project Relevance to DHS S&T Mission / Impact of Project

Project Progress

➤ ***Site Data Collection – Sherman Island***

- *Installation of 3 autonomous GPS stations*
- *Characterization of the subsurface properties*
- *Geotechnical parameters and constitutive relationship*

➤ ***Model Calibration***

➤ ***Baseline Case***

➤ ***Probability of Exceeding Limit State and Uncertainty***

- *Levee Section fragility in terms of probability of exceedance versus flood cycle and level*

➤ ***REES Comparison***

- *Establish the coupled model-monitored data approach to identify vulnerabilities of the levee.*

End User Engagement

NBC
NBCBAYAREA.COM

End User	Role in Project	Interactions to date	Interaction Outcome
California's Department of Water Resources (DWR) – Joel Dudas, John Paasch, Kent Zenobia	Levee Owner; Advisors; Delta Flood Emergency Preparedness, Response and Recovery Program	Many – Most recently Dec. 12 and 19, 2016	Review of geotechnical parameters and cross-section geometry used in model; Feedback on REES software and role of remote sensing in future work.
US Army Corps of Engineers (USACE)	Advisors; Leveraged support	Several – Most recently Sept. 2016	Funding for upgrading in situ instrumentation at one site in New Orleans

End User Engagement

Model of Sherman Island Levee Cross Section

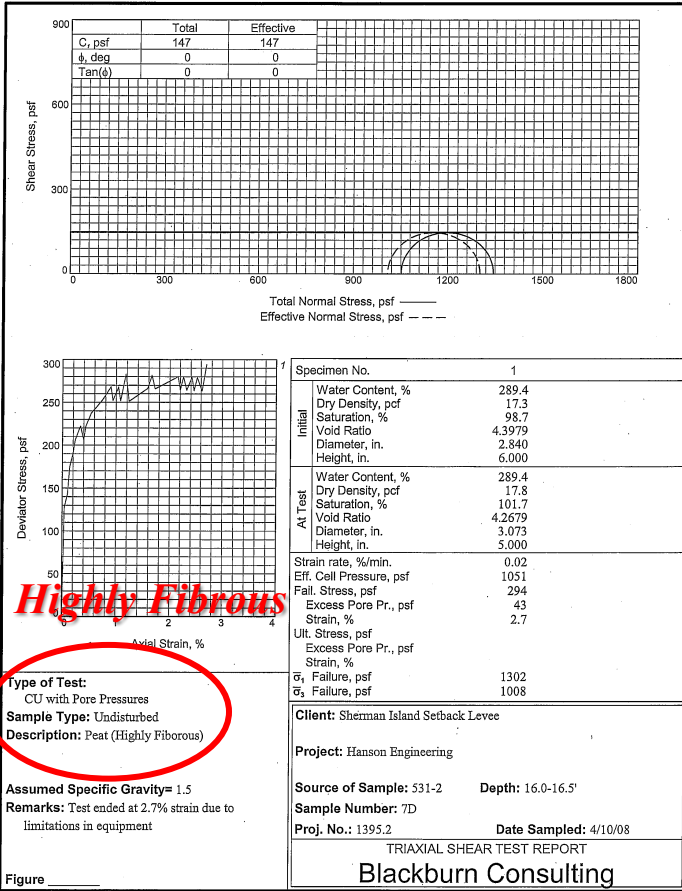

Numerical Model

- Model levee section on Sherman Island
- Large deformation option in PLAXIS 2D
- A fine mesh with 15-node elements was used with the domain having 1961 elements and 15975 nodes
- Soft Soil Creep Model (SSC) in PLAXIS 2D

Finite element PLAXIS 2D levee mesh and boundary conditions

Blackburn Consulting APPENDIX

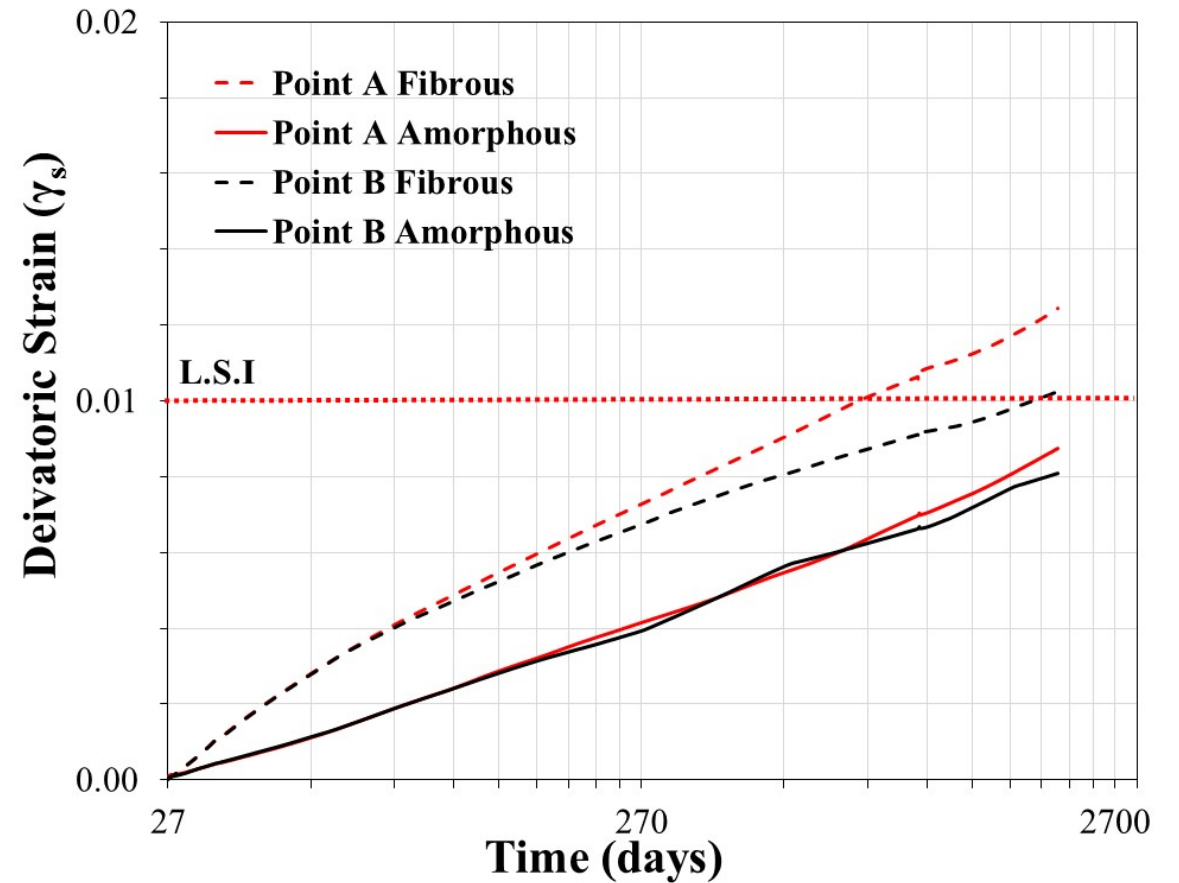

Displacement with time for fibrous peat versus GPS data (points A and B are indicated on the model cross-section)

Vertical Displacement with time for fibrous and amorphous peat.

Total Deviatoric Strain (γ_s) with time and limit state criteria for mean value of $C_a/C_c=0.06$.

Observations from the Modeling

- **The use of amorphous peat properties shows stiffer response and lower compressibility than fibrous peat, which agrees with literature (Mesri et al., 2007). The assumption of amorphous peat led to lower computed displacements overall.**
- **The analyses indicated a relatively small mechanistic deformation induced by “extreme” water level under transient conditions. This is in comparison to the continuous and large deformation induced by the compression of the peat layer. The high-water level will however affect the exit hydraulic gradients and may lead to critical conditions, as was discussed by Jafari et al. (2016).**
- **The variability in the reported values for compression coefficients (C_c and C_α) for fibrous and amorphous peat suggests these values need to better defined as a function of fiber contents, state of decomposition, and water content. A parameter in terms of cellulose and lignin content can provide insight as to the chemical composition of the materials and the related shear strength with aging for more accurate performance assessment of the levee.**

FLOOD EMERGENCY RESPONSE INFORMATION EXCHANGE (FERIX)

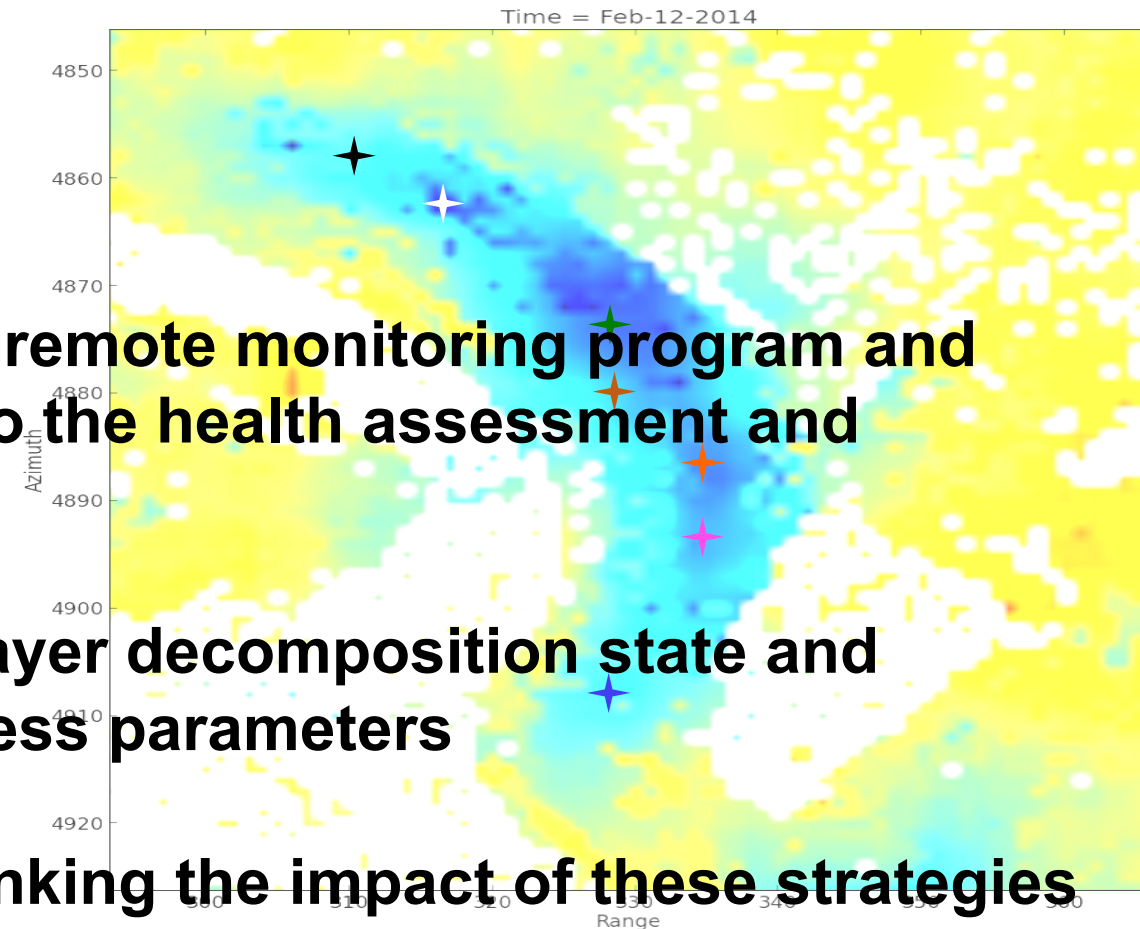

Anticipated Project Impact

- **Effective means for remote damage-identification on a large scale**
- **Continuous assessment of remedial strategies and their impact on improving the levee condition and the corresponding system-level resiliency**
- **Availability of a tool for estimation of risk for various combinations of embankment geometry and cyclic flood loading without the need to run sophisticated numerical analyses**

Proposed Follow-on Work

- Continuation of and User Interface for the remote monitoring program and incorporation of the 3-D data collected into the health assessment and performance modeling
- Quantitative characterization of the peat layer decomposition state and associated changes in strength and stiffness parameters
- Development of remedial strategies and linking the impact of these strategies on resilience of water, ecological, and economical resources through system-level life cycle analysis
- Extension of the REES tool to include time-related aspects of peat degradation and stability in terms of flood and drought loading
